

# Azure CLI (az)

## Simplifying Cloud Development

### From Zero to Deployed in Minutes

# Command Your Cloud: Mastering Azure with AZ CLI

```
D:\>az --help

Group
  az

Subgroups:
  account      : Manage Azure subscription information.
  acr          : Manage private registries with Azure Container Registries.
  ad           : Manage Microsoft Entra ID (formerly known as Azure Active Directory, Azure AD, AAD) entities needed for Azure role-based access control (Azure RBAC) through Microsoft Graph API.
  advisor       : Manage Azure Advisor.
  afd          : Manage Azure Front Door Standard/Premium.
  ai-examples  [Preview] : Add AI powered examples to help content.
  aks          : Azure Kubernetes Service.
  ams          : Azure Media Services resources.
  apim         : Azure API Management services.
  appconfig    : Manage Azure App Configuration.
  appservice   : Manage App Service plans.
  aro          : Manage App Service Plans.
  openshift    : Manage Azure Red Hat OpenShift clusters.

To search AI knowledge base for examples, use: az find "az"

# Rule Azure from the Terminal: The Power of AZ CLI

# Agenda

- What is Azure CLI?
- Installation & Setup
- Demo(s)
- Queries/Output Formatting
- Automating tasks w/ scripts
- Q&A

# What is Azure CLI?

---

Cross-platform  
command-line  
tool

Manages Azure  
resources via  
commands

Runs on Windows,  
macOS, Linux,  
Cloud Shell, and  
Docker

# Why Azure CLI?

---

Speed & Automation

---

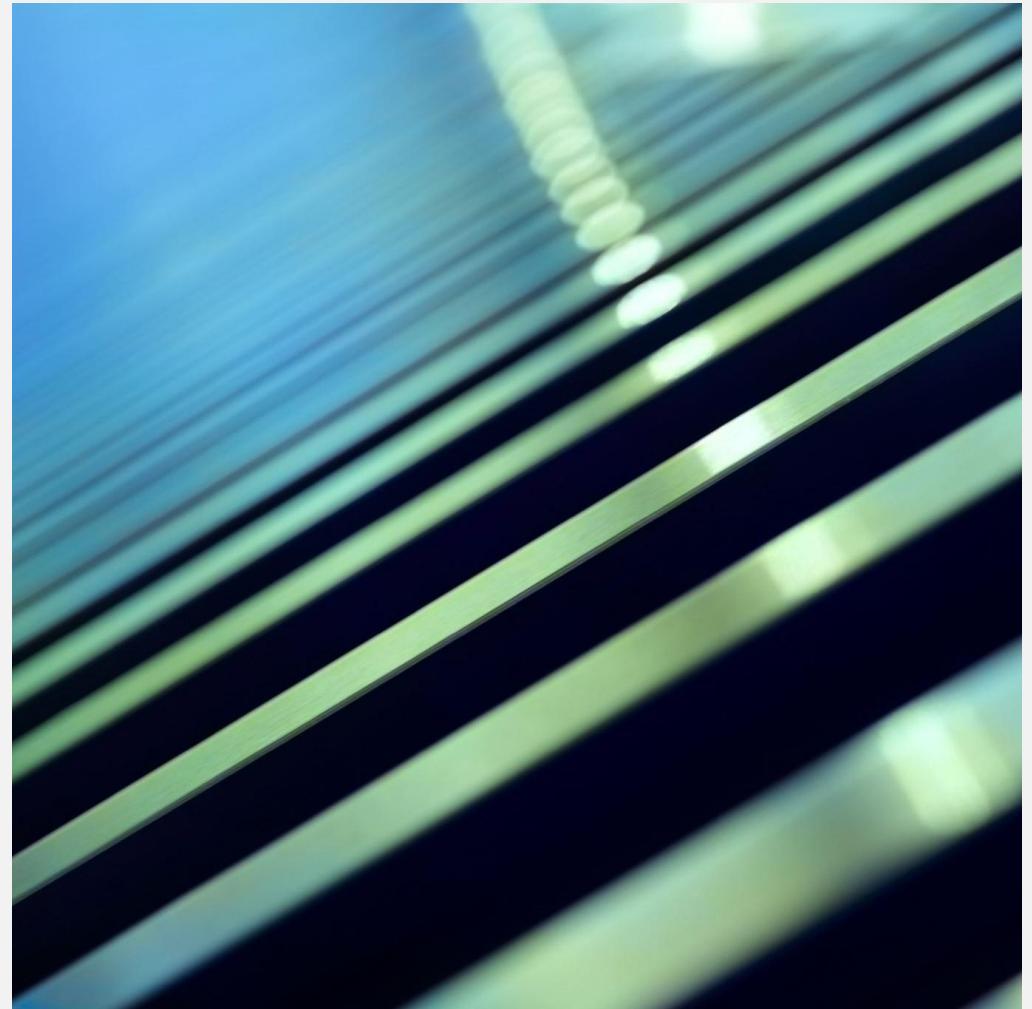

Scriptable & Reproducible

---

Ideal for DevOps & CI/CD

---

Complements (not replaces) Portal  
and PowerShell

# Installation & Setup

- Install on Windows/macOS/Linux
- `az login` for authentication
- Works with Service Principals & Managed Identity

# Command Structure

- Pattern: `az <group> <subgroup> <command> [parameters]`
- Example: `az group create --name MyResourceGroup --location eastus`

# Environment-specific guidance

Shell	Line Continuation Character	Script extension
Bash	\	.sh
PowerShell	`	.ps1
Cmd	^	.bat

## Additional References

# Creating Resource Groups with az cli

- Create a resource group

```
az group create --name rg-azclidemo --location eastus
```

- List resource groups

```
az group list
```

- Does Group exist

```
az group exists --name rg-azclidemo
```

- Delete a resource group

```
az group delete --name rg-azclidemo
```

# Demo 1a — Resource Groups

```
# Create Resource Group  
az group create --name rg-azclidemo-001 --location eastus
```

# Demo 1b — Networking

```
# Create Virtual Network
az network vnet create `

--name vnet-azclidemo-eastus-001
--resource-group rg-azclidemo-001
--address-prefixes 10.0.0.0/16
--subnet-name snet-azclidemo-eastus-001
--subnet-prefixes 10.0.0.0/24
```

# Demo 1c — Storage

```
# Create Storage
az storage account create \
--name stazclidemox001 \
--resource-group rg-azclidemo-001 \
--location eastus \
--sku Standard_LRS \
--kind StorageV2
```

Note: Storage account must have globally unique names.

If you are having trouble with the script change the storage account name

# Demo 1d — Compute

```
# Create VM
az vm create \
--name vm-azclidemo-001
--resource-group rg-azclidemo-001
--vnet-name vnet-azclidemo-eastus-001
--subnet snet-azclidemo-eastus-001
--image Ubuntu2404
--size Standard_B1s
--admin-user adminuser1
--generate-ssh-keys
```

# Demo 2

- A. Putting it all together
- B. Variables
- C. Output

# Environment-specific guidance

Shell	Line Continuation Character	Script extension
Bash	\	.sh
PowerShell	`	.ps1
Cmd	^	.bat

# Output Format

--output or -o	Description
json	JSON string. This setting is the default
jsonc	Colorized JSON
table	ASCII table with keys as column headings
tsv	Tab-separated values, with no keys
yaml	YAML, a human-readable alternative to JSON
yamlc	Colorized YAML
none	No output other than errors and warnings

## Examples

```
az account list-locations –o table
```

```
az account list-locations –o yamlc
```

# Querying

JMESPath (JSON Matching Expression Paths)

```
az account list-locations --query
```

"[].displayName"

```
"[].{Name:displayName, Location:metadata.physicalLocation}"
```

```
"[].displayName | [0:5]"
```

```
"[?metadata.geographyGroup=='US'].displayName | [0:5]"
```

```
"sort_by([],{Name:displayName, Location:metadata.physicalLocation}, &Name)"
```

# Advanced Feature — Interactive Mode

- az interactive
- Autocomplete & suggestions
- Great for learning

# Advanced Feature — Automation

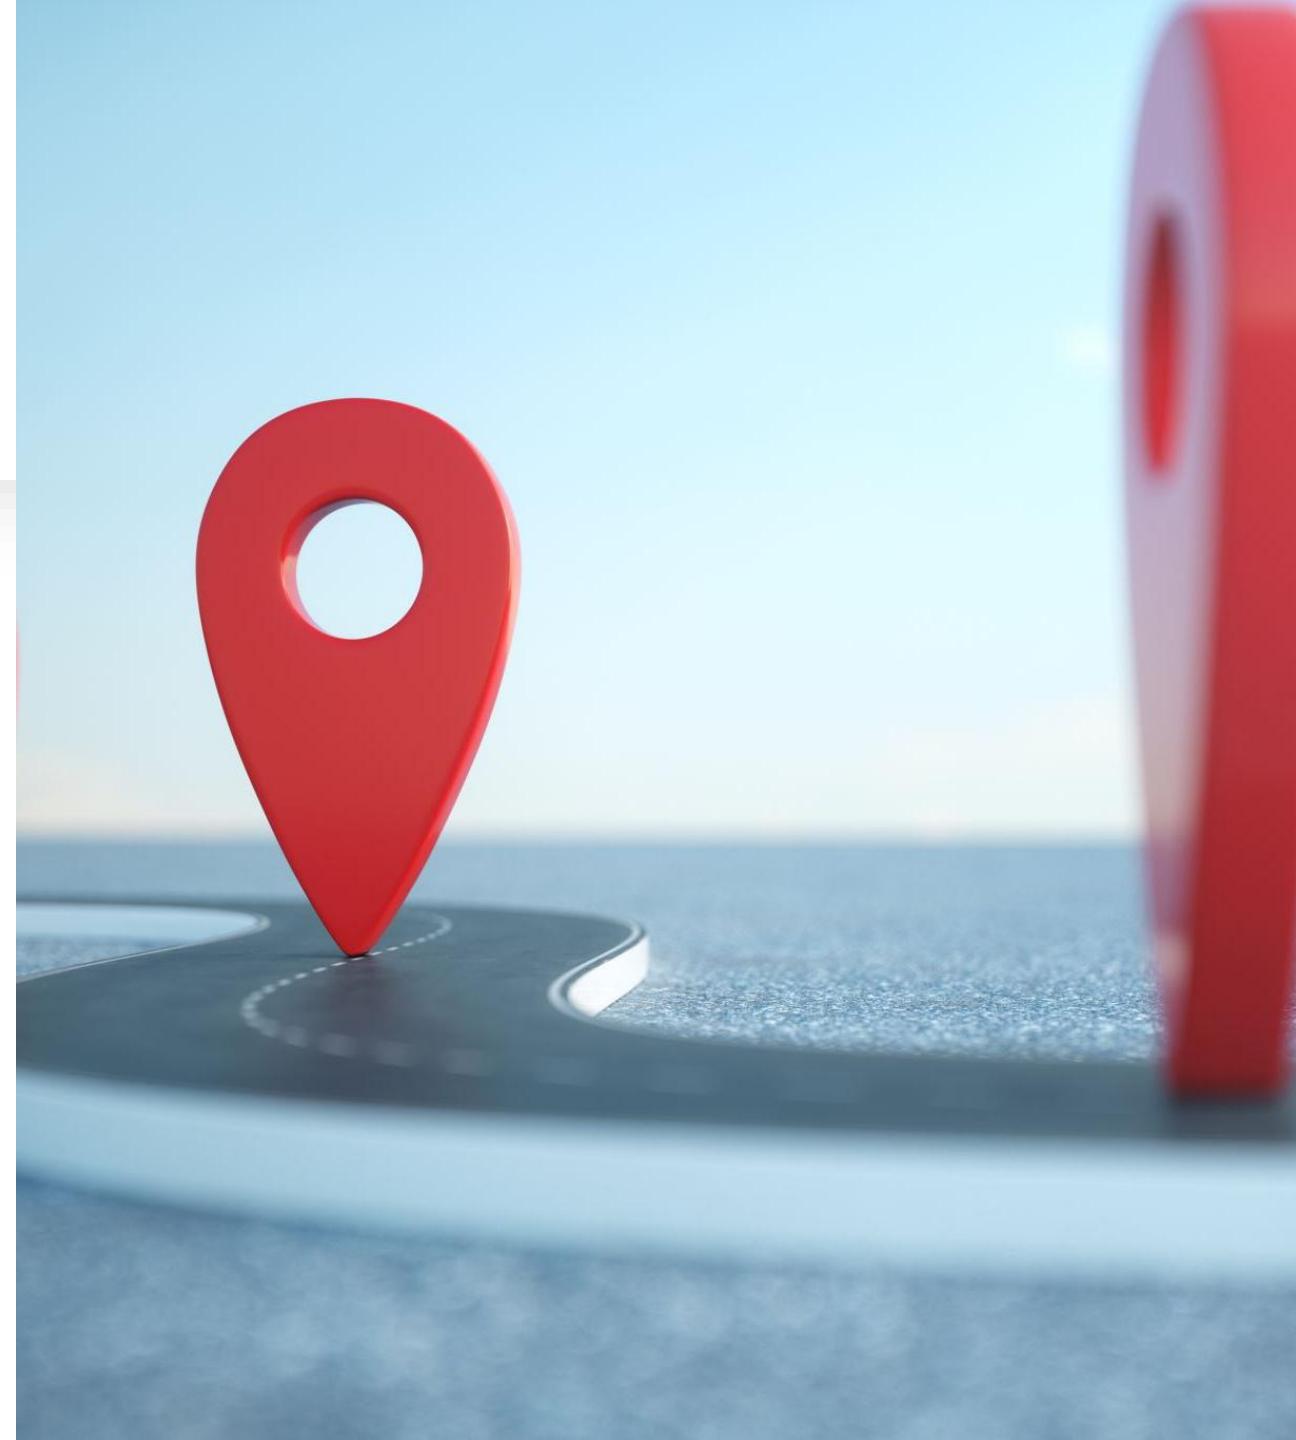

- Bash, PowerShell, GitHub Actions, Azure DevOps
- Example: `az deployment group create` with ARM/Bicep
- Useful for CI/CD

# Tips & Tricks

- Use `--output table` for readability
- Use defaults with `az configure`
- Use tags for organization
- `az find <command>` for quick help

# Resources

- Microsoft Docs: Azure CLI  
<https://learn.microsoft.com/cli/azure>
- Azure Samples on GitHub  
<https://github.com/Azure/azure-cli>

# Recap & Q&A

- Azure CLI is powerful, cross-platform, scriptable
- Complements Portal & PowerShell
- Great for automation and DevOps
- Explore interactive mode, queries, and pipelines
